

MyFiber Automated Speed Test

Windows 11 • Version 2 • Daily Full-Page Screenshot Automation

Purpose: Automatically run an Internet speed test from Windows 11, capture the completed MyFiber page with date/time and computer name, and store the evidence on the company network share.

Default: Daily at 10:00 AM | Website: myfiber.co.in | Output: PNG

1. Solution Overview

Windows Task Scheduler starts the PowerShell script once per day. The script launches Google Chrome in headless mode, opens the MyFiber page, starts the test, waits for Download/Upload results, adds a timestamp and computer name, captures the full page, and writes the PNG to the network share.

Components

Component	Purpose
Windows 11	Runs the automation.
Task Scheduler	Starts the test at the configured time.
PowerShell	Controls the workflow and storage.
Google Chrome	Loads the MyFiber page.
Chrome DevTools Protocol	Clicks/inspects/captures without normal GUI interaction.
Network share	Stores the screenshots centrally.

Network destination

\\192.168.21.19\newfolder

For many laptops, a later version can create one folder per computer, such as \\192.168.21.19\ewfolder\PC001\.

2. Test Page and Result Images

The following are illustrative images showing the expected workflow. They are examples, not live network measurements.

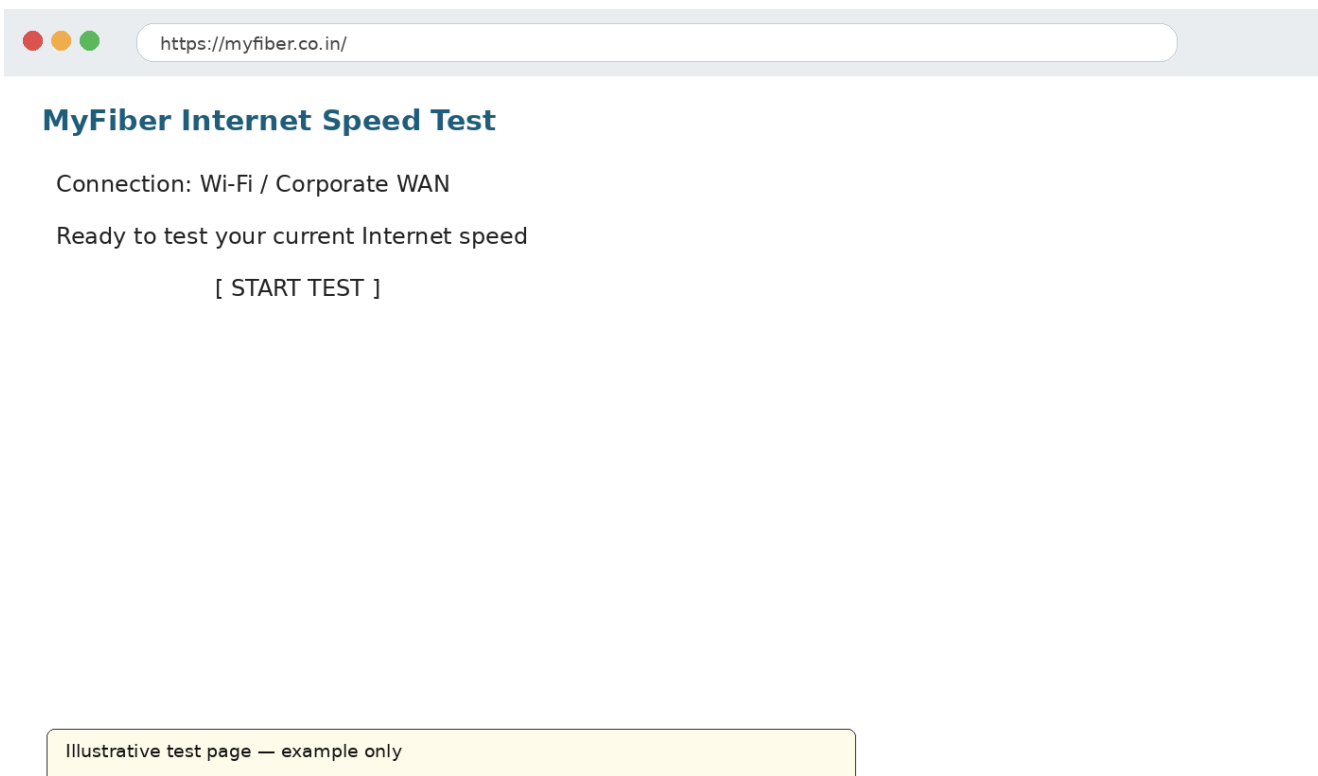

Figure 1 — Example Start Test state.

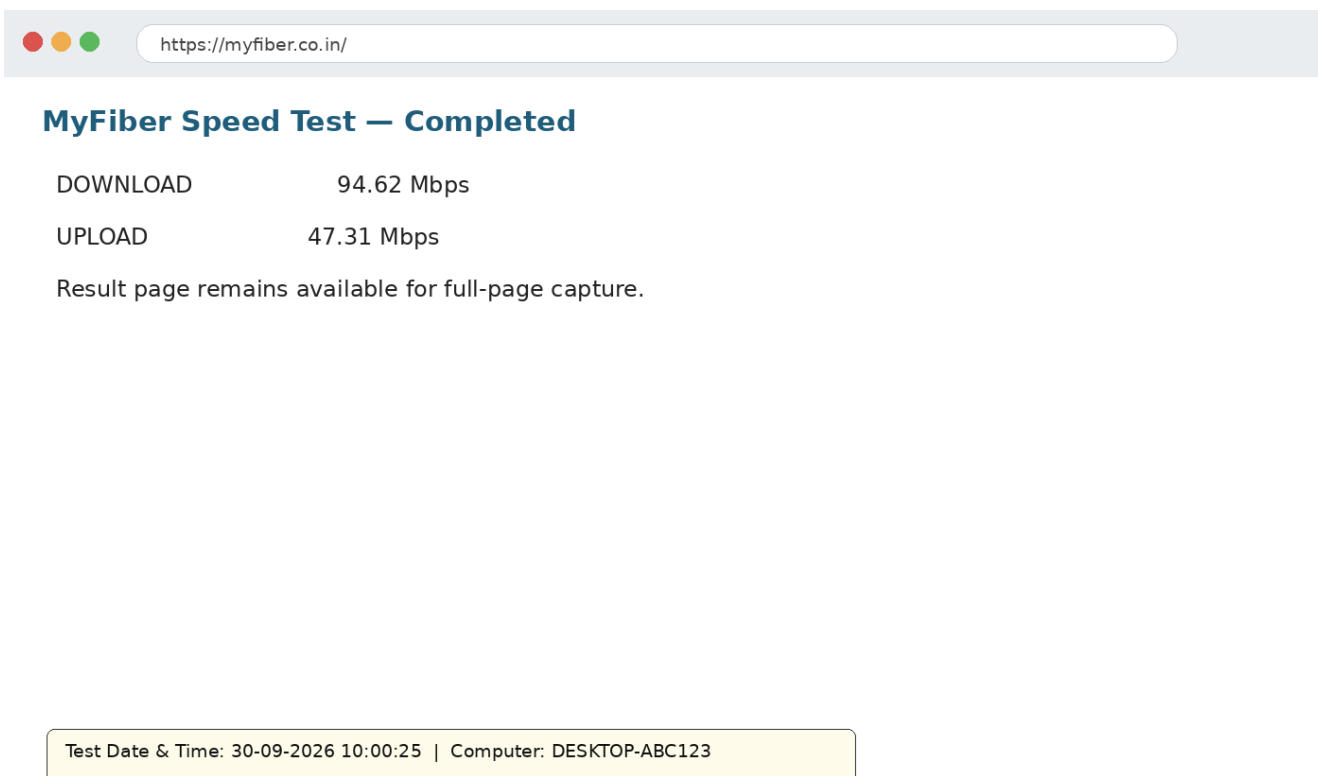

Figure 2 — Example completed result with timestamp overlay. Example values are not measured results.

3. Installation — Windows 11

Place the supplied MyFiber-SpeedTest-V2.ps1 in a permanent folder, for example:

```
C:\IT\MyFiber\MyFiber-SpeedTest-V2.ps1
```

Keep this path unchanged after creating the scheduled task.

Verify Chrome

Chrome must be installed and usable by the Windows account that runs the scheduled task.

Verify the network share

```
Test-Path "\\192.168.21.19\newfolder"
```

Expected result: True. If False, fix network connectivity or permissions first.

PowerShell execution policy

```
Set-ExecutionPolicy -Scope CurrentUser RemoteSigned
```

Run the installer/first test

```
powershell.exe -ExecutionPolicy Bypass -File "C:\IT\MyFiber\MyFiber-SpeedTest-V2.ps1"
```

The script installs the daily task and, by default, performs one immediate test for validation.

4. Automatic Scheduling

The default setting in Version 2 is:

\$RunAt = "10:00"	
Time	Setting
09:00 AM	\$RunAt = "09:00"
10:00 AM	\$RunAt = "10:00"
02:30 PM	\$RunAt = "14:30"
11:00 PM	\$RunAt = "23:00"

Scheduled task name

MyFiber Daily Speed Test
Task Scheduler > Task Scheduler Library

MyFiber Daily Speed Test	
Status	Ready
Triggers	Daily — 10:00 AM
Action	powershell.exe — MyFiber-SpeedTest-V2.ps1 -RunTask
Run mode	Interactive user
Start after missed schedule	Enabled

Figure 3 — Illustrative Task Scheduler configuration.

5. Network Share Permissions

The scheduled-task account needs permission to write to the share. Both share-level and NTFS permissions may apply.

Check	Expected
Share	\\192.168.21.19\newfolder is reachable.
Read	Account can list the folder.
Write	Account can create a file.
Modify	Account can create the PNG without manual elevation.
Network	Laptop is connected to the corporate WAN/Wi-Fi at test time.

Manual write test

```
$file = "\\192.168.21.19\newfolder\test.txt"
"MyFiber share test" | Out-File -FilePath $file -Encoding utf8
```

If this fails, fix permissions before troubleshooting the browser automation.

6. Screenshot Evidence and File Naming

Version 2 uses the computer name and timestamp in the filename.

```
MyFiber_DESKTOP-ABC123_2026-09-30_10-00-25.png
```

The timestamp and computer name are also rendered visibly on the page before capture. This helps identify evidence later.

Recommended future CSV log

Date/Time	Computer	Download	Upload	Status
30-09-2026 10:00:25	DESKTOP-ABC123	94.62	47.31	Success
01-10-2026 10:00:28	DESKTOP-ABC123	91.10	45.20	Success
02-10-2026 10:00:00	DESKTOP-ABC123	-	-	Failed

CSV logging is a recommended next enhancement; Version 2 focuses on full-page PNG evidence.

7. Troubleshooting

Chrome not found

```
Get-Command chrome.exe -ErrorAction SilentlyContinue
```

If Chrome is installed in a non-standard location, update the Chrome paths in the script.

Network share unavailable

```
Test-Path "\\192.168.21.19\newfolder"
```

Check corporate network connectivity and access rights. Do not hard-code passwords into the script.

Test does not start

The website can change its HTML, button labels, or anti-automation behavior. If the page opens but the test does not start, update the script's click-detection logic against the current page.

Result not detected

Version 2 waits for recognizable non-zero Download/Upload values. If the provider changes labels or units, the result-detection expression may need updating.

Scheduled task does not run

```
Get-ScheduledTask -TaskName "MyFiber Daily Speed Test"  
Get-ScheduledTaskInfo -TaskName "MyFiber Daily Speed Test"
```

Verify the PC is available at the scheduled time and the task account can access both Chrome and the network share.

8. Remove or Change the Schedule

Remove the scheduled task with:

```
powershell.exe -ExecutionPolicy Bypass -File "C:\IT\MyFiber\MyFiber-SpeedTest-V2.ps1" -Uninstall
```

To change the time, edit \$RunAt and reinstall the scheduled task.

9. Recommended Version 3 Enhancements

Enhancement	Benefit
CSV/JSON log	Searchable Download/Upload history.
Per-PC folders	Cleaner storage for many laptops.
Central dashboard	View WAN performance trends.
Failure alerts	Notify IT when tests fail or fall below a threshold.
Randomized window	Avoid all laptops testing simultaneously.
GPO/Intune/RMM deployment	Consistent domain-wide deployment.
Retention policy	Archive/delete old screenshots automatically.

10. Deployment Checklist

■	Chrome installed.
■	MyFiber opens from corporate WAN.
■	Start Test works.
■	Download/Upload results appear.
■	Network share is accessible.
■	Windows account can write to share.
■	Manual first test succeeds.
■	Scheduled task exists.
■	First scheduled screenshot verified.
■	Filename contains PC and timestamp.

Important: Images in this guide are illustrative test images. They are not live measurements from your network. The actual Version 2 screenshot will contain the results available when the test runs.
